

Self-loading, self-propelled bale wrapper is powered by a front-mounted 5 hp Briggs & Stratton gas engine direct-coupled to a two-stage hydraulic pump.

**“ONE PERSON CAN WRAP A BALE A MINUTE”**

## SP Bale Wrapper Needs No Tractor

By Bill Gergen, Associate Editor

“Our new self-propelled, self-loading bale wrapper frees up a tractor and works much faster than conventional pull-type or stationary bale wrappers. It lets one person wrap at least a bale per minute,” says Tom Freis, Newton, Wis., who displayed the new rig at the recent World Dairy Expo in Madison, Wis.

Freis is a farmer-dealer who sells a variety of round bale handling equipment. The machine itself is built in the U.S. by Corry-Armstrong. The company modified a stationary Corry bale wrapper by adding a big drive wheel and steering arm on front, an axle and 10-in. flotation wheels on back, and a bale lift arm on one side. Power is provided by a front-mounted 5 hp Briggs & Stratton gas engine direct-coupled to a two-stage hydraulic pump. An orbit motor chain-drives the front wheel and another one rotates the unit’s turn table. The lift arm and table dump are operated by hydraulic cylinders.

The operator walks in front using control levers mounted on the steering arm. One lever is used to raise or lower the lift arm, one to rotate the turn table, one to dump the bale, and one to power the drive wheel forward or backward.

“It’s the fastest bale wrapping system on the market because it’s so easy to maneuver compared to a tractor-pulled unit. One person can haul bales in from the field and wrap them and still keep up with the baler,” says Freis. “It works so simple that anyone can

operate it. The idea arose after using a pull-type self-loading wrapper that couldn’t keep up with the baler. I was still wrapping bales into the night, hours after the baler had quit for the day. I added a second wrapper but I still couldn’t keep up. Then I tried using a stationary wrapper. It kept up with the baler but required an extra tractor and operator to wrap the bales.

“I use a wagon to carry about 12 bales at a time either to the end of the field or to my yard. After I have about 60 bales lined up in a row I wrap them. I generally finish wrapping only about 20 minutes after the baler has quit for the day. After I’m done I can pull the wrapper behind my pickup at highway speeds to the next field. The front of the rig raises hydraulically to get the drive wheel off the ground.”

The lift arm is adjustable for bale width and diameter. A standard lift arm lock out valve eliminates the possibility of inadvertently raising the arm when the table isn’t in the proper position.

The unit is available with a 5, 8, or 9 hp engine. A standard unit equipped with a 5 hp Briggs & Stratton engine sells for \$12,800. Freis also sells Welger silage balers that chop hay before baling it, as well as Highline bale processors and movers and Balemaster loader-mounted bale grabbers.

CHOPPER CHOPS THEM UP**

## New-Style Stalk Chopper Fitted With Rubber Tires

“It lets you break up the life cycle of insects and diseases that overwinter in standing stalks and does a much more thorough job of clearing and chopping residue. It’s simply the best stalk chopper ever built,” says Christian Nichols about his company’s new-style stalk chopper that uses spinning rubber tires to pull stalks out by the roots and then chops them up with a drum-type chopper that follows behind.

Amadas Industries unveiled its prototype machine at the recent Sunbelt Agricultural Exposition near Moultrie, Ga.

It features a gang of heavy-duty 8-in turf tires mounted on drive shafts up front. They’re chain-driven off a ground-driven gearbox on the machine’s left side and are adjustable from 6 to 18 in. off ground. The tires rotate against each other to pull stalks.

“You can operate at ground speeds of up to 13 mph. The faster you drive, the faster the tires rotate. They pull stalks out down to their roots so they can be completely chopped by the chopper behind the tires,” says Nichols. “The ground-driven chopper drum is fitted with 14-in. long blades, one

Developed for cotton, the machine can also be used in corn and sorghum.

set per row. They chop stalks into 4 to 6-in. pieces.”

Developed for cotton, the machine has also been successfully tested in corn and sorghum, Nichols notes. Available early in 1997, the stalk puller/chopper will come in 4 to 8-row units for 30, 32, 36, or 40-in. spacings. It’ll be priced at \$18,000 to \$22,000.
