

Meet the GrainMaker® Family

Bitterroot Tool & Machine manufactures every GrainMaker® mill in their Montana machine shop. Their family of mills easily handles all types of grain and seeds, from tiny flax seeds to kernels of corn and legumes. The powder-coated finish and hardened steel burrs clean up easily.

GrainMaker® mills are handcrafted of welded steel, not cast. Every part of the mill including the body, handle, hopper, stainless steel GrainBreaker auger and high-quality alloy grinding burrs are made on-site. The exclusive grinding burrs - one stationary and one rotating - are owner Randy Jones' unique design. They are individually machined using a process that has enabled GrainMaker® to proudly include them as part of each mill's lifetime guarantee. GrainMaker® mills have sealed bearings for smooth, maintenance-free operation. The larger mills also include an exclusive adjustable 'click and lock' control knob for coarse to fine grinding, and an extended handle for better leverage.

Four models are available, ranging from

the 3-cup Model No.35 (which weighs 10 lbs. and stands 13 in. tall) to the 10-cup Model No.116 (weighs 43 lbs. and stands 14 ¼ in. tall). A custom-built geared electric motor is available that slides directly onto the shaft without bulky guards, pulleys or belts. A do-it-yourself motorizing kit is also available that lets you use your own electric motor as well as a bicycle kit that lets you drive a mill with a standard geared bicycle.

Owners Randy and Bonnie Jones' desire is to provide heirloom quality mills. This is reflected in their commitment to working directly with their customers and providing a full lifetime heirloom guarantee and a 30-day satisfaction guarantee.

Hay Merger Handles Up To 6 Rows At A Time

The Hay Merger, distributed by The St. George Company, allows you to quickly merge up to 6 rows into one for fast pickup and baling. It also transfers hay and straw without picking up dirt or other contaminants.

The unit can move the crop to the left or the right, or deposit it down the center. The continuous merger features a revolutionary 3-head system which allows for picking up swaths of any width or configuration without being row sensitive. Hay or straw is lifted gently while keeping it free of dirt or foreign material. After lifting, the material is placed on a self-cleaning belt which leaves the windrow light and fluffy to promote fast drying.

With harvesting machinery increasing in size, the Hay Merger allows you to build windrows of any size, by re-merging already merged rows without sacrificing crop quality. The Hay Merger guarantees a high quality crop thanks to its remarkable suspension system, which controls ground pressure and oscillation of all the pickup heads as well as the transport wheels.

The Hay Merger is available in five widths from 7.6 meters to 10.8 meters and is powered by the tractor's pto.
